SOP: Propagation of Adult Normal Human Dermal Fibroblasts (Lonza

Bioscience)

Date modified: 02/01/2010 Modified by: E. Giste (UW)

Ordering Information

Adult Normal Human Dermal Fibroblasts (NHDF-Ad) may be ordered either as frozen ampoules or as starter cultures. The former contain ~ 0.5 -1 x 10^5 cells; the latter are initiated at Lonza and sent in a T225 flask containing ~ 6 -7 x 10^6 cells.

To order frozen ampoules + media:

Name: NHDF-Ad – Adult Normal Human Dermal Fibroblasts

Item #: CC-2511 (NHDF-Ad - Cryopreserved ampoule)

CC-3132 (FGM-2TM BulletKit® = CC-3131 + CC-4126)

To order starter cultures:

Name: NHDF-Ad – Adult Normal Human Dermal Fibroblasts Item #: CC2511T225 (NHDF-Ad in FGM-2TM T225 Flask)

CC-3132 (FGM-2TM BulletKit® = CC-3131 + CC-4126)

Notes:

The number of BulletKits purchased depends on the target number of cells to be generated. A rule of thumb is 10 BulletKits for every initial T225 flask of cells. It is strongly recommended to purchase all of the media that will be required for a complete expansion series, since media supply may be erratic.

Materials List

- 1. Cell-type specific medium (BulletKits Lonza Biosciences)
- 2. T225 culture flasks
- 3. Graduated pipets (1, 5, 10, 25, 50mL)
- 4. Pen-strep solution (if required; Lonza typically supplies antibiotics)
- 5. Phosphate Buffered Saline (1X PBS) (Cellgro, Cat# 21-040-CM)
- 6. Accutase Enzyme Cell Detachment Medium (EBiosciences Cat# 00-4555)
- 7. Hemocytometer
- 8. Micropipet w/ P20 tips
- 9. Microscope

Procedure

A. Receipt of proliferating cells

- 1) Swab down flask with 70% ethanol.
- 2) Equilibrate for 3-4 hours in 37°C, 5% CO₂ humidified incubator.
- 3) Remove shipping medium. Replace with fresh medium and return to incubator.

B. Sub-culture

- 1) Propagate cells until density reaches 60-80% confluence.
- 2) Aspirate medium.
- 3) Wash cells with warm 1X PBS.
- 4) Add 15mLs of Accutase and return to incubator for 10-15 minutes.
- 5) Immediately remove cells, rinse flask with warm 1X PBS to collect residual cells, and pellet at 500 x g for 5 minutes (4°C)
- 6) Gently re-suspend cell pellet in warm medium.
- 7) Count cells with hemocytometer.
- 8) Add warmed medium to flasks.
- 9) Seed flasks at **3,500 cells/cm²**
- 10) Record each subculture event as a passage.

C. Maintenance

- 1) Change media the day after seeding and every OTHER day thereafter.
- 2) Increase media volume as confluency increases (volumes assume the use of T225 flasks):
 - a. 25 % = 1 mL/ 5 cm 2
 - b. 25-45% = 1.5mL/ 5 cm²
 - c. 45%+ = 2mL/ 5 cm2.
- 3) Per the above an exemplary schedule might be:
 - a. day 1, plate into T225: use 50 mls of media.
 - b. day 2, change media, use 50 mls of media
 - c. day 4, change media, use 100 mls of media (if confluency is >50%)
 - d. day 6, change media, use 100 mls of media (or harvest if ready)
 - e. day 7 or 8 (harvest when cells reach 6 x 10⁶ cells/flask).

D. Harvest

- 1) Pass cells 3-4 times until the desired cell number is achieved (primary cells will senesce after 4-5 passages).
- 2) Remove cells from flasks according to protocol described above under 'Sub-culture'.
- 3) Examine viability using Trypan blue staining (SOP TP-7).
